Abstract

Expressed Sequence Tags (ESTs) isolated from the unicellular red algae, *Cyanidium caldarium*, are disclosed. The invention encompasses nucleic acid molecules that encode *Cyanidium caldarium* protein homologs and fragments therof. In addition, antibodies capable of binding the proteins are encompassed by the present invention. The disclosed ESTs have particular utility in isolating genes and promoters, identifying and mapping the genes involved in developmental and metabolic pathways, and determining gene function. The ESTs provide a unique molecular tool for the targeting and isolation of novel genes for plant protection and improvement. The invention also relates to methods of using the disclosed nucleic acid molecules, proteins, fragments of proteins, and antibodies, for example, for gene identification and analysis, and preparation of constructs.
